MOS can track equipment maintenance, facility maintenance and ground maintenance as well as many other types. Due to its flexibility, it is adaptable to any asset that would require preventive maintenance (PM). MOS keeps track of your preventive maintenance services for each object and informs you when maintenance is due automatically based on the maintenance service definitions you provide.

Notification of maintenance due is a completely automated process which uses color coded indicators on the main screen. Objects that are due for service are shaded a red color and objects which are soon due for service are shaded a yellow color. You can instantly see what objects require attention.

With each maintenance entry that is saved, a preventive and repair maintenance history is automatically generated detailing all of the maintenance performed on the object and costs. The maintenance history is used to generate detailed cost analysis reports and can be used to monitor trends in neglect, abuse, or simply aging equipment.

MOS can be integrated with our complete ERP system which include Customer Relatiionship Management, Human Capital Management, Supply Chain Management, Financial Management, Warehouse Management   additional features includes a QR coding, RFID, Dashboard Management and a report customization utility which allows you to modify any of the reports we provide with the software. MOS is a feature-rich software package that is extremely flexible, easy to use, and affordable.
